DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-11 are rejected under 35 U.S.C. 102(b) as being anticipated by Peterson (3860930) or Fitzpatrick (4635067).

Regarding Claims 1-11, Peterson shows in Figs. 10 and 11, a method for mounting a rotatable reflector, and antenna, on an aircraft within a particular swept volume of rotation, supporting the main reflector 40 on a platform 102, using a motor 103 to rotate the platform 102 about an azimuthal axis along the shaft 104, and locating the main reflector on the platform so the axis of rotation is disposed forward of a plane extending perpendicular through the axial center of the reflector 40, and through a plane intersecting the outermost ends of the reflector, all arranged as claimed. The outermost ends of the reflector intersect the axis of rotation plane. The reflector is fed with a feed horn.

3. Claims 1-11 are rejected under 35 U.S.C. 102(b) as being anticipated by Fitzpatrick (4635067).

Regarding Claims 1-11, Fitzpatrick shows in Figs. 6a-d, a method for mounting a rotatable reflector 48, and antenna 31 fed with a transmission line (waveguide) and rotary joint (see column 3, lines 45-48), on an aircraft within a particular

swept volume of rotation, supporting the main reflector 48 on a platform, using a motor to rotate the platform about an azimuthal axis 46, and locating the main reflector on the platform so the axis of rotation is disposed forward of a plane extending perpendicular through the axial center of the reflector, and through a plane intersecting the outermost ends of the reflector, all arranged as claimed. The outermost ends of the reflector intersect the axis of rotation plane. The reflector is fed with a feed horn and rotary joint.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claim 12 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peterson or Fitzpatrick in view of Sefton (4831384).

Sefton is cited as resolving the level of ordinary skill in the antenna art and as evidence of obviousness and shows in Fig. 2 a rotary coaxial joint 3 for coax 15,15 that feeds the feeder 2 and reflector 1. It would have been obvious to the skilled artisan to employ such a joint in the Peterson or Fitzpatrick devices.
